# Habitat Replication for the North Coast Study Region

Presentation to the MLPA Master Plan Science Advisory Team January 21, 2010 • Eureka, CA

Dr. Pete Raimondi, Member • MLPA Master Plan Science Advisory Team

#### Valuation of habitat size

- Habitat size
  - Did not consider connectivity or adult movement
    - These are accounted for in marine protected area (MPA) size and spacing guidelines
  - Based on conservation value
    - How much area or linear distance would likely result in X% of available species in meaningful abundances.
    - In other regions 90% of available species has been the required percentage
      - Underlying assumption (related to conservation goals) is that 100% is desirable, and that this may be achieved with enforced protection

#### Area versus linear distance

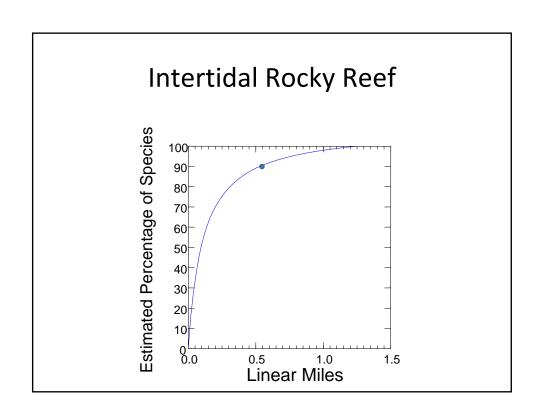

- For habitats where the biological community varies more with depth than area, the key measurement is linear distance (distance along coastline). This assumes that the zone of protection extends from shoreline to the offshore edge of that habitat. Such habitats include:
  - Rocky Intertidal
  - Shallow rocky reefs
  - Kelp forests
  - Shallow sandy habitat
- For other habitats the key measurement is area. Such habitats include:
  - Deep rocky reefs
  - Deep sandy habitat
  - Estuaries

#### Data considerations

- Need spatially explicit data for biogeographic area
  - Allows assembly of areas of varying sizes
  - Maintains a realistic set of species

### **Analysis**

- Spatially explicit abundance data
- Resampling
  - Areas or distances of increasing sizes
    - Average number of species in 1000 iterations of size 1, 1000 of size 2, etc.
    - Likelihood of a species occurring increases with increasing abundances
- Fit curve to resampled data

## Habitat replication

Habitat	Amount needed to encompass 90% of biodiversity	Data Source
Rocky Intertidal	~0.55 linear miles	PISCO Biodiversity
Shallow Rocky Reefs/Kelp Forests (0-30 M)	~1.1 linear miles	PISCO Subtidal
Deep Rocky Reefs (30-100 M)	~0.13 square miles	Starr surveys
Deep Rocky Reefs (>100 M)	~0.13 square miles	Starr surveys
Sandy Habitat (0-30 M)	~1.1 linear miles	Based on shallow rocky reefs
Sandy Habitat (30-100 M)	~7.6 square miles	NMFS triennial trawl surveys 1977-2007
Sandy Habitat (>100 M) - contiguous	~6 square miles <sup>1</sup>	NMFS triennial trawl surveys 1977-2007
Sandy Habitat (>100 M) –non-contiguous	~17.2 square miles <sup>1</sup>	NMFS triennial trawl surveys 1977-2007
Sandy Beaches	~ 1.1 linear mile	For discussion
Estuarine Habitats	Analysis not complete yet	
<sup>1</sup> Habitat is limited	<sup>2</sup> mixture of vegetated marsh, subtidal, and mudflats	

## Habitat replication

Habitat	Amount needed to encompass 90% of biodiversity
Rocky Intertidal	~0.55 linear miles
Shallow Rocky Reefs/Kelp Forests (0-30 M)	~1.1 linear miles
Deep Rocky Reefs (30-100 M)	~0.13 square miles
Deep Rocky Reefs (>100 M)	~0.13 square miles
Sandy Habitat from sandy beaches to sandy habitat >100 M (where >100 M is available).	10 square miles including at least 1.1 linear miles of sandy beach habitat
Estuarine Habitats	To be completed
